I have acquired a used 68060 cpu off Ebay. Yeah, I know - you pays your
money and you takes your chances.

Anyways, one pin is broken off and a few of the rest are bent. It looks
like its previous owner was non too careful with it.

Anychance this can be repaired or is it a goner?

Thanks.

That probably depends on which pin is broken, but the odds
are good that you bought a paperweight.

You can probably straighten the pins with the proper tool, it's a block which takes the body of the IC with the legs either side. Two spring-loaded pieces either side are squeezed in against all the pins at once. If they're bent towards the narrow ends of the IC then all bets are off unless you're careful with tweezers etc.

As for the broken off pin, I've repaired this sort of damage by milling down from the top of the package to meet the leg where it enters the body, with a modeller's drill you should be able to get enough metal to solder a wire to.

This will be a work of desperation of course...

Using a chip depends on who you are. I have sent some chips with broken pins back to the manufacturer for failure analysis, and they manage to connect to them. If you can get at a surface to connect to, and can solder to aluminum, you have it made, unless you melt the thing.

You did this on a ceramic PGA?

Usually, the broken off pin leaves a metal surface on the ceramic that can be soldered to. If not, this may be unrepairable.

cu

Hi,

I was looking over a Mega motherboard and noticed this capacitor was snapped in half. It looks like a filter cap and seems to be connected across the power supply pins for U12 (74LS11N). I would guess it would be .1 uf, but I want to make sure before I unsolder it and replace it. Can anyone verify this.. Thanks

Rory

Hello

I have a manual for the Mega STe, and all the bypass caps are .1 uf. But, if it matters, the chip numbers are three digits.

OK, easier way. Mega manual. C 9~21 are 0.1 uf 25 v cer axial, on first page of parts list.

Done. Quit.

Jim

Rory McMahon <rorymcmahonNOSPAM@yahoo.com> writes:

: Hi,

: I was looking over a Mega motherboard and noticed this capacitor was
: snapped in half. It looks like a filter cap and seems to be connected
: across the power supply pins for U12 (74LS11N). I would guess it would
: be .1 uf, but I want to make sure before I unsolder it and replace it.
: Can anyone verify this.. Thanks

: Rory

Ah, you've found me out ;-)

DIL chip.

If the vendor will refund money then...

Is the Distance Selling reg. a UK-only rule, a full refund within a time
period because the goods were bought sight unseen?

Hi, guys.
I just had a weird power fault in my area, the kind with blinking lights, and unfortunately I just had my falcon in the boot process.
Now, my boot IDE disk won't boot anymore. I can see it's there with my HD utilities, along with the ither IDE and the SCSI one, but I can't access it.
Looon g time ago, it happened something similar and I remember I had to reformat it. May I do something different now? Don't know, like restoring the boot sectors or such? Thanks.
Regards.

Cleaning out the closet. This is a fully working(needs new ribbon cartridge)Panasonic KX-P1092 dot matrix Multi-Mode printer I'm giving away for only the cost of packing/shipping to you. I used this printer many years with my STe before switching over to the other guys. I have the drivers for this if needed.

Interested persons may respond privately, first come first served.

The same moron who's been spamming a bazillion groups for the past six
months.
Just keep sending abuse reports...

Seems to have a hate thing going for Matt Parker, I guess. This could be someone far gone into some kind of paranoid fantasy trip. Who knows? This does not seem like the kind of thing a sane person would do, but how do you define sanity these days?

Michael

What is the best way to remove the old Dallas chip and install a socket for
a new chip?  Seems like a tough job.

Tim

Not really. If you have some desoldering experience, it should be no problem
to de-solder the old chip pin by pin using a handheld de-soldering gun - in
my experience, this works better than desoldering braid.

The methos that does the least damage to the PCB is cutting all the pins of
the old chip and removing the remaining pins one by one, and then removing
the tin from the holes. However, with the Dallas chip, it may be a bit
difficult to get at the pins - however, if you cut through the plastic, this
should work.

cu

Addresses:
Matt Parker 1505 Ash Ave Cottage Grove 97424 OR USA
Matt Parker PO Box 1147 Cottage Grove 97424 OR USA
Telephones:
1 541-942-5087 <Disconnected>
1 541-942-6145 <Disconnected>

The aforementioned sites abuse credit card information and have software to track visitors. Most profiles of the personals were stolen from dating sites that provide the same copyrighted material for free. Registered members of these sites also have access to underage personals featuring adult material depicting minors in explicit sexual acts.

The individual behind these sites trades underage girls from the Philippines and Russia that are being lured to the USA with false promises of work, marriage and the green card, and are eventually forced into prostitution.

Information:
http://tinyurl.com/5em8l
http://web.archive.org/web/20020110131808/http://goasia.about.com/library/weekly/aa072501c.htm

Sollicitation of minors:
http://love.topograf.ru/index.php?pg=view&id=51985
Translation: http://www.online-translator.com/default.asp?lang=en

Material evidence:
http://ukraine.fuckingteen.net/directory/ukrainian_girls-7.htm

The individual that operates these sites manipulates facts using Email/IP spoofing
and forged server logs to make others seem guilty and is part of an international
criminal network supported by corrupt politicians.
NEVER BELIEVE ANYTHING HE SAYS OR WRITES AND NEVER DISCLOSE ANY PERSONAL DATA.
This suspect is an expert at manipulating people and the public opinion.

Anybody who is concerned about the safety of minors can file complaints with:
http://www.ftc.gov
http://www.consumer.gov/idtheft
https://www.econsumer.gov/imsn/wimsnery2$com.main?p_lang_seq=1
http://www1.ifccfbi.gov/cf1.asp

Check that you've got enough headroom for replacing the keyboard.

Consider removing top of NVRAM chip and connecting a button cell
externally.

You're welcome.

With my experience and my iron, I would desolder the old chip and put in a
socket simple as that.  For most people I recommend good old dremel as
Derryck suggested as it's much easier (even if a little more dangerous if
you dig too deep).

Thanks,
Mark

Yes I would also like to desolder the old chip and install a nice socket.  I
think I will try to cut all the legs first and then unsolder each one,  one
by one.

Thanks
Tim

Anyone have one they could spare?

I am in the USA.

Thanks,
Tim

Hi Folks,

Does the Falcon's IDE controller support two IDE devices?

Has anyone tried an IDE CD-ROM drive to see if it would work?

Just curious...

-dreq

Not sure if the onboard IDE does or not, but you can get a small after-market board from places like Best Electronics and Wizztronics that will allow 2 2.5, 2 3.5, or a combination thereof...Its something like $39.95. I believe that Extendos Gold supports IDE CDROMs when used with HDDriver (later versions).

HTHs.

The Megafile 30 uses a RLL HDD - MFM drives should work also, but since
the specs for RLL are higher, using a MFM drive on a RLL controller is
not recommended.

Whoa! 20 Bucks for an old RLL-drive seems quite a high price (OK, there are other vendors with 99 USD price tag...)!

IMHO the drive should work, but I would recommend looking for an used ST with compelete HDD (either Megafile or a SCSI device) - should be way cheaper!

Bye,
   Fritz

An RLL drive is an MFM drive, except that the drive gives approx 50%

more capacity when formatted RLL (Run Length Limited) with an RLL controller. If your megafile is an ACSI=>RLL controller (which IIRC it is) then this drive would work fine (assuming it works - how is the seller able to test???).

Coda.

Actually, the board I'm talking about is different than the simple 2.5"
to 3.5" (and I guess, as you say, vice-versa) conversion cables that I
think you are talking about.

Here is the blurb from Best Electronics:
This Small Adapter board from Wizztronics, will allow you to Connect/Use
up to Two, Yes Two IDE Hard Drives on your Stock Falcon Computer! You can
install, one 2 1/2 inch IDE Internal Hard Drive (like the Stock 80 Falcon
Hard Drive) and a second Internal IDE 2 1/2 Drive or a Second External 3
1/2 IDE Hard Drive or Two Large External 3 1/2 Hard Drives! This
Wizztronics Small IDE Hard Drive adapter board, plugs into the Existing 44
pin IDE male connector under the stock Falcon   internal Hard Drive
Bracket! To secure the IDE adapter bracket to the Falcon Motherboard, you
have to bend up one leg of the Falcon Hard Drive bracket and secure the
Wizztronics adapter card to the motherboard with a Supplied screw and
spacer! After the IDE adapter card is installed, you can install your
stock Falcon 80 meg hard drive using the Stock 44 pin Ribbon cable! To
install a second 2 1/2 internal IDE Falcon hard Drive you will have to
purchase a Second 44 pin IDE cable (Best part # CB102147). A 40 Pin IDE
ribbon cable and Power cable Jumper cable are supplied with this Falcon
IDE adapter board so you can install an External 3 1/2 IDE Hard Drive (40
pin Ribbon cable and Power jumper cables fit thru the T/B Falcon case set
behind the Falcon).

PS I didn't have to bend anything to get it to work on my Falcon.

The Falcon DOES support 2 ide devices, if you get a 44 pin cable with
two connectors on it all you need to do is change the ID select on the
second drive. As far as those 3.5" converters are concerned, you can
get them on ebay for ~$5. They are meant for plugging a 2.5" drive
into your PC, but you can use them the other way round also (I do).
Some boards are a little too large because there is a large capacitor
right next to one end of the Falcons IDE port, I had to lift one end
of the cap to make room. Also, some people report problems with long
IDE cables (Standard cable is ~10-15cm/4-6"). The Falcons IDE
implementation is poor, the signals are unbuffered so you need to keep
the cable as short as possible.

Later Extendos Gold versions support IDE CD drives when used with
HDDriver, using the SCSIDRV command set.

Coda.

I notice this question has been asked before, various informative responses were posted, but no good solution came out of it.

I want to run laserC on a STacy I have been given (which replaces the 520 I was also given some time ago, which replaced my original 1040 when it died many years ago, which itself replaced an original 520).

The laserC v2.0 shell refuses to run on the STacy. It says you must first run a program called patch.prg

The LaserC v1 shell runs ok, but it appears that you can't run gem programs from it (well actually then run fine, but then you can't return to the shell, which is the same thing when playing with some (now very old) code I have).

For now I am using the laserC v1 shell with my LaserC v2 compiler (and etc).

Some earlier posts claim that if you have laserC v2 then you should get a file called patch.prg, but my laserC v2 must be too old or something, cause it doesn't have this file.

Some other posts claim there was a laserC v2.1 which solved all these problems - all I can say is that I was a registered user, and never notified of any upgrade to 2.1- I would have bought it if I had known about it then.

Anyway, what I would really like is the file PATCH.PRG that apparently came with some distributions of LaserC 2.0, so if anyone has it then plase let me know.

One post mentioned instructions for tweaking the system to make it work - those instructions would also be appreciated.

Another post mentioned bugs in the STacy system, and that various bug fix accessories should be run to solve these problems, but the only program name mentioned did not turn up on google - so any pointers to further info on this topic, if it is a valid concern, would also be appreciated.

Thanks, malcolm

Well, okay - I'm dumb, got 2 left feet, all thumbs, and now that we've got that out of the way and understood I need some help.

I just bought a Wizztronics Falcon rack case and I'm trying to get it setup with an ATX power supply. Its a JustPC (USA)Inc, model jpc-425-12v rated at 430watts max. I've never used it before, but its brand new.

Wizztronics sent me an e-mail with this info:

I checked with the service department, the following should help you wire the power supply. Simply cut the connector from the stock supply and solder it to the cut wires of the PS2 power supply. Please tape or use heat shrink tubing on all splices.

The power switch is one to one as it was wired to the ps2 supply.

If you have any question please don't hesitate to ask.

All Black are ground from pc connector, all heavy red are +5V and yellow is +12v

ATARI Connector	PC Power Connector
Red	Red 5V
Red	Red 5V
Red	Red 5V
Black	Black GND
Black	Black GND
Black	Black GND
Black	Black GND
Blue	Yellow 12V

The difference being of course, I'm using an ATX, not a PS2. Would that make a differnce? Because right now, when I hook everything up according to this info, I've got nothing, no power to the Falcon, no fan on the powersupply itself, no peripherals like floppy or CD working.

I searched google a bit and found this website:

http://www.myatari.net/issues/dec2001/casemod.htm

which had some interesting things in it. I tried hooking up the gray line like they suggested, still no go.

Anyone have any ideas, or better yet - someone here who has actually done this? I'd appreciate any help! Thanks. :-)

The difference is that the ATX need to connect on wire to gnd as power switch. You need a pinout of an ATX supply and look to the color/pin of the power switch.

> which had some interesting things in it. I tried hooking up the gray line like they suggested, still no go.

Grey, white, green.. that�s a thing of the manufacture.

ATX gray -> power button -> gnd (normaly!)

All other connections you have got from wizztronics.

> Anyone have any ideas, or better yet - someone here who has actually done this? I'd appreciate any help! Thanks. :-)

Thake a multimeter to check them all!

Wrong connections let you falcon smoke.

Regards, Robert

Maybe I've found a use for the Falcon in the closet...
Are there any external SCSI CD writers which work with
the Falcon? I need one which can copy a Joliet/Windows
CD-ROM.

My company develops and sells software and I've checked
the prices on CD duplicators and they are a bit pricey. An
alternative is to copy on the Mac, two Windows machines
and perhaps even the Atari Falcon at the same time. That
might work, at least for a while.

So has anyone copied CD-ROMs on the Falcon? Which
CD burners can you recommend? Are there any external
SCSI burners made these days or are they either IDE,
USB or internal SCSI? It should be relatively fast, would
prefer at least 32x.

Which software? Cannot spend too much. Would prefer
free software which does the job.

M

Right, its the accepted standard but not necessarily followed by all manufacturers.

> All other connections you have got from wizztronics.

I double checked them, as far as the connections go they are solid.

> Thake a multimeter to check them all!

Okay, with everything disconnected from the powersupply, I can't get any readings from it at all. The fan doesn't come on, a simple ac/dc test light won't show power anywhere (holding to yellow wire and ground wire, also tried more than 1 black ground wire and even tried grounding against the metal powersupply case. Why won't this brand new PS even come on? Is it possible I have a bad one from the start?

> Wrong connections let you falcon smoke.

Yeah, I was afraid of that - I hope my newbie bumbling hasn't had this result. :-(

Some PC power supplies require a load to power up. A PC floppy connected to the floppy power cable of the power supply should work.

Only to GND. Not to +12, not to +5, not on metal case.

> it possible I have a bad one from the start?

Thats possible, or you test with the yellow cable waste the ATX.
Normaly any ballast must be connected to the +5, +12 output.
Use light blubs simple to test it.

Regards, Robert

Hmm, I did the yellow wire (12v) and GND *first* before I tried anything else with the simple ac/dc test light. It did not work from the start.

Thanks.

Well, I've got a floppy drive and a CDRW hooked up to it. Still no go -
I'm beginning to think "its dead, Jim"... :-)

Thanks.

Yamaha CDR400T is one CD writer which works well with the Falcon. You
won't be able to write at very high speeds anyway, so this one suits
very well.

> USB or internal SCSI? It should be relatively fast, would
> prefer at least 32x.

Data rate is far above the capability of a Falcon AIUI.

> Which software? Cannot spend too much. Would prefer

Best is Extendos by Roger Burrows, commercial.

Okay, well finally - after much googling, hacking around, and talking with a couple of friends of mine, I've got my Falcon powering up off an ATX power supply.

Here's the catch - its NOT the gray PWR_OK wire on this particular power supply that you have to use. Its pin 14, the green wire. Run from the green to ground and the power supply (and thusly my Falcon and peripherals) boots right up.

Thanks to everyone who offered help and advice, its always much appreciated!

Now...lets go finish up the odd bits - power and hard drive LEDs, etc, etc.

:-)

Anyone got docs to, or a url with info about, the DEKA (detachable extended keyboard interface). Its the little device that lets you use an XT or AT/PS2 style keyboard with your Atari.

I've got one in my Falcon rack case, but with it connected, I get -no-video to my monitor. With it unconnected, video is fine.

Thanks!

Never mind - some of you all just line up and kick me. I had the keyboard
header on the motherboard 1 pin off. Video is back now.

Thanks.

Is there a guideline or general info on the Falcons floppy setup? I'm having lots of problems with mine. The owner before me replaced the original floppy with a Sony model. He also replaced the cable. Anyways I'm getting lots of read errors and many times, the floppy isn't found at all.

Any general suggestions about what to check? The cable and ps are hooked up solid, I checked those. I've tried more than 1 floppy disk - the ones I tried work fine on my Linux box.

Thanks.

I would just get a EPSON SMD-340 or 300 1.44 drive, it is the direct
replacement and it should work out of the box. I got a few from a local PC
surplus store as a backup for a few bucks. Older PCs had these in them.

well, check for the steprate, maybe you need steprate.prg...
otherwise, cleaning and stuff would also help :)

Hmm, if it is the floppy drive itself, that would work. I'll google around
and see what I can find. Thanks!

I'll check that out - seems like I do remember something about PC floppy
drives operating just a tad bit different than the original Atari model.

This would not help with auto-booting games though, would it? I know, some
games have an auto folder that you could put the program in, but most
don't. Just a thought.

PS I did clean it... :-)

Lonny! Long time no hear guy. I used to frequent the Atari IRC channel as
"DarkChyld" and "DarkLord". I used your excellant software. Its really
good to speak to you again. :-)

I'll take that advice and grab it in the next bit, thanks much!

Sam,
FYI, This advise is for a non-CT60 Falcon. The ATX power supply
should be plug and play for your CT60 Falcon. The CT60 powers your
motherboard through the falcon floppy connector when everything is
connected properly. Follow the instructions for the CT60 (on
czuba-tech website).

Ronald,

I'm certain I followed the instructions but, how does the falcon then power up?
My atx psu does not have an on/off switch, and my falcon did not power on.

Thanks,

Sam F.

Yes, I had already posted this reply when I realized from a different
posting from Sam that he was talking about the CT60 (lucky dog!) :-)

I apologise if there was any confusion.

Sam, did you read the other couple of messages in this thread yet? I posted a reply earlier not realizing that you were talking about hooking up a Falcon with the CT60 and an ATX power supply.

The instructions for that are different than what I'm doing - I don't have a CT60 (although I'd crawl naked thru broken glass for one!) <grin>.

Have you checked the instructions on Rodolphes' web site? That would be the first place I'd start.

Sorry if I confused the issue.

Hi guys. I've got HDDriver v7.61 and an 80 gig Maxtor 3.5" IDE drive. I
know that before, depending on what TOS version you had, partition sizes
and numbers were limited, correct? (something like 1 gig per partition,
and partions from c thru p?)

I'm sure there are newer versions of HDDriver now - will it let me use
the entire 80 gig drive on a Falcon 030 with TOS 4.04?

Thanks!

You'll need an OS able to use FAT32. It's not possible with plain TOS
(or maybe with BigDOS?). FreeMiNT or MagiC can do it.

Bye,
/Pascal/

 Whew!
Had me worried there for a sec :) I also have a CT-60 and glad to hear
its plug and go (I would neve be able to fix my own PS, would had to
beg someone here to do it for me) hopefully i will soon have my Falcon
up and running

RonaId,
I don't know, but I don't think it's exactly plug and play...I plugged mine but it didn't play!! This weekend I'll try out another psu and see what happens.
But if you all have any pointer, please let me know.

Thanks

There may be room in the bootsector for such an application, would only take a 1/2 dozen bytes.

This is for all CT60 owners:

I still have my falcon in the bottom half of it's case. I don't have the hardware yet to move the mb to the AT tower server case I have.

I installed the ct60 on the mb. I connected the falcon's floppy power lead to the ct60, being mindful of the color orientation, I plugged a dell atx psu to the ct60. I plugged a power lead from the psu to the floppy drive. I placed a boot floppy in the drive, and plugged in the power cable to the psu and......nothing, zero, zip nada.

What did I do wrong? AFAIK, I hooked everything up according to Rodolphe's NO Solders instructions.

dear Atarians,

Isn't kinda scary to learn just now that Dennis Vermeire
had died on May 19, 2004...
Where are our friends when we need them ?

Dennis was a great Atarian, may he rest in peace.

groetjes, Rein

A friend's TT suddenly stopped booting some time ago (almost a year now...). I checked it and found that it had lost contact with both SCSI harddisks, internal and external.

In HDDriver "Ger�te check" the internal drive showed up correct but the external only with garbage characters.

I took the external drive (and cable) over to my place and it worked OK. Also tried another drive on his TT and still got similar garbage.

With the external SCSI disconnected everything runs perfect.

Went over there again yesterday and copied the exact output from HDDriver Ger�te check and found out that bit 7 (out of 8) is zero on all the characters! The other bits are all correct.

Is the TT internal and external SCSI connectors in galvanic contact with each other or is there some chip in between?

The motherboard terminal resistors have been removed. Perhaps one of the 8 bus lines have no contact, but would I be able to access the drive at all if that is the case?

Any ideas?

Yes, provided you use MiNT or MagiC. The maximum partition size for TOS 4.04 is 1 GB, and HDDRIVER can do nothing about it. You need an operating system replacement in order to get bigger (FAT32) partitions.

Thats what I needed to know - I'm going to Mint as soon as I can acquire
an accelerator of some sort for my Falcon.

Thanks Uwe! :-)

This is correct. Take care you do NOT use the blue wire from the ATX
supply.

>...Because right now, when I hook everything up according
> to this info, I've got nothing, no power to the Falcon, no fan on the
> powersupply itself, no peripherals like floppy or CD working.
>

Your supply is not starting. Connect only the floppy (disconnect the
Falcon) and connect a wire from "power on" to ground. ATX supplies
expect a momentary power switch, but most don't care if it's constant.
Once you figure out which wires work, connect them with a momentary
switch accessible once you close up the case.

There are, but new SCSI CD writers are no longer being made.  You
might find a few old stock still.

> So has anyone copied CD-ROMs on the Falcon? Which
> CD burners can you recommend? Are there any external

I often do, using a pair of Panasonic 7502s.  Note that 4x burning
often fails.  I find 2x is reliable, but often use 1x just to be sure.
>
> Which software? Cannot spend too much. Would prefer

I think free software exists, but I am not sure.  Extendos Gold + CD
Writer by Anodyne Software works well, but is not cheap.

Okay, I just got a Wizztronics memory board for my Falcon. It requires a
```

70ns 16 meg SIMM, 4x32, or 4x36.

Who still sells these SIMMS, and what would be the best recommendation
with the idea that (hopefully) somewhere down the road, I might have a
CT60 in the same machine.

Thanks everyone!

Yeah, yeah, I know - replying to yourself is bad form and all that. :-)

Anyways, I googled and found a Kingston 4 x 32, 16 meg, 72 pin SIMM for
$15.00. The only thing is, its 60ns instead of 70 or 80, as mentioned in
the memory boards' instructions.

Would that be okay? (or even better?)

Thanks!

It should be OK, but you won't see any speed improvement. I've never
heard of a problem using faster RAM. Where did you find a Wizztronics
board?

If all else fails, one can post a request in
misc.forsale.computers.memory, which I have done twice for two memory
projects. Several dealers read that group, and sell some unusual memory
that way.

Hi Ronald, I will lock through my Box of ram and check if I have any
spare. Where are you located? Pretty sure I have 16MB EDO, but FWIR
Fastpage is neccesary. Yup, I have 2 Mitsubishi 16 meg 72 pin EDO's.
60ns made in Germany. I have to check the garden shed yet, tho;-).

Well...I'm here in the United States. It looks like you're in Australia?
(isn't that the au in your address?).

The price is not expensive here, so I'll probably just buy a new one.

I sure appreciate the offer though! :-)

Well the same thing happened to me when I hooked up an external SCSI drive to my Hades060 which uses the same the TOS as a TT. The drive had two ports on it. One worked fine and the other caused the garbled characters. I also got the garbled characters when I tried to also hook up both my scanner and the external drive. I am thinking it may have something to do with termination.

Hey gang, I'm having some trouble with the Falcon memory board I bought.

I bought some new, Kingston 60ns, 5v, 16 mb, 4x32, 72 pin SIMMS the other
day (I bought 2 'cause they were pretty cheap, $11 apiece). They only will
install one way, they are one-sided. After installing either one, and
plugging it into the Falcons MB, the system won't boot up, no HD activity,
and no signal to the monitor. I can switch back to the stock Atari 4 meg
board and all works well again.

Any ideas on what I might be doing wrong?

Thanks.

Well, that memory board was probably made quite a few years ago.
Perhaps there's a bit of tarnish on the connectors? Secondly, the
SIMM has to go in pretty deep. Perhaps the SIMM isn't seated enough?
Finally, are you absolutely sure the Wizztronics board went in
correctly? (All of these are fairly obvious problems, but I've made
each one myself at one time or another.)

There's also the possiblity of the memory card not set correctly. (I
believe there's a solder point or jumper to switch from 4Mb to 14Mb,
although I'm not entirely sure). Are you sure your SIMMS are EDO? I
don't know if FPM will work. Are your SIMMS composite (chips on both
sides)? Composite SIMMS have some compatibility issues.

I'm sorry I don't have any hard answers. Best of luck getting it
working.

Galen

I understand - I installed it, uninstalled it, and reinstalled it about 5 times last night. :-)

> There's also the possiblity of the memory card not set correctly. (I believe there's a solder point or jumper to switch from 4Mb to 14Mb, although I'm not entirely sure). Yes, I checked that as well, according to the instruction sheet, it appears to be set for 14 megs. They are 1 sided chips - all on one side (8 total).

I'm pretty certain they are EDO as well.

Thanks for the reply - I'll play around with it again this evening when everyone else has gone to bed (3 kids). :-)

Wild guesses only, because I do not have a Falcon, and do not have a Wizztronics board for one, but have met some memory-no-work siturations.

On each memory stick, there are four pins that indicate size. Or, are supposed to indicate size, but sometimes indicate speed or something else.

A memory card has to know, usually, what size memory stick is in it. It looks at those pins, and if those pins do not match the actual size, the assembly will not work as desired.

There are several numbers on the memory sticks, and one of them is some part of a part number. Try a google search for Kingston, and whatever numbers you find on your memory stick, and eventually you will get to the data sheet, which will tell you which pins are used, and what they put there. I suspect, on no information whatever, that 60ns sticks have the speed there, rather than the size.

If so, a magnifier, a 15 watt soldering iron with a very small tip, some wire-wrap wire, and a hobby knife to cut paths with might help. You need to make the power-ground status of the four pins match the size.

If I am right, you will find that the 70ns data has the pins set to show size, and you need to make your 60nschip pins match that.

Jim

> Any ideas on what I might be doing wrong?

My best guess is the wrong memory type.
Give Wizztronics a call.

I've one of these boards along with a CT2b and it works fine.
Rather than taking a chance on duff memory, I had Wizztronics send me a 'tested and populated' unit.
Either way, I'm sure they can/will recommend a memory type.

Brian

Yep, I talked to Brad and he said that they certify, validate, etc, etc, every board before they ship it, so he's gonna send me some memory that will work with it.

Thanks to everyone who answered! :-)

Well I got home this afternoon and UPS left me a nice present :) All I

can say is I'm soooooooo glad i got me a Falcon Rack before they ran
out of em (they said like 16 or so left). Anyone who is planning on
recasing thier Falcons and don't have the tools or knowledge on
kit-bashing a pc case I would urge you to consider this case as an
option..Very well made (heavy boy too...) and all the port holes are
cut and ready for extension cables.. considering it wasn't much more
then the nicer PC cases that are out there its well worth the
investment.. now just some spare time and i can recase my Falcon in
style :)

Thomas

....not to mention that in my view a Falcon has no business being in a PC
Tower case! A rack mounting system is more in keeping with the design and
philosophy of the Falcon and gives it a unique look! My Wizztronics case for
my CT60 Falcon is on its way! :)

I am in Houston Texas, looking to buy Atari Falcon, mo luck on eBay.

Anyone have one for sale or know where I can find one?

Thanks,

Ken

Yes, this should work.

Can you send me the serial number of your HDDRIVER please, so that I can
register you? I did not find you in my database of registered users.

Hello Uwe,

US> Can you send me the serial number of your HDDRIVER
> please, so that I can register you? I did not find you
> in my database of registered users.

I do not yet use HDDRIVER, but I hear good things about it
and would consider buying it if it would help with things
like Zip disks and large hard disks. Does HDDRIVER play well
with MiNT, or does it get bypassed once the kernel is
loaded?

- Andy Ball.

The other way, the FreeMiNT kernel use the XHDI interface from HDDriver to access big partitions (this isn't possible through the old TOS-BIOS interface).

Regards,
Frank

Thanks for the clarification. It certainly sounds as though
HDDriver makes sense for MiNT users too.

- Andy.

Hello all,

I am re-casing my Falcon, and am going to use a MegaST keyboard. Where can I find an adaptor for the Mega keyboard?

Thanks

Sam F.

Sam, you can get a cable from Best Electronics that I believe, will allow
you to plug in either a Mega ST or MegaSTE keyboard to the Falcon. HTHs.

Brad is the owners name, and he's just the best. :-)

This is their website:

http://www.best-electronics-ca.com/

This is the specific page:

http://www.best-electronics-ca.com/520_1040.htm

Scroll down, you'll find this:

Megamater Cable for the 520STFM, 1040ST, 1040STE / 4160STE This short
inexpensive cable assembly (8 pin connector to 6 pin Phone jack) allows
you to interface a complete Mega free standing Keyboard assembly (Best
part # CB101513 keyboard + CB101539 keyboard cable) to your STFM / STE
computer. All you have to do is unplug your STFM / STE internal keyboard
connector, plug in Megamater cable and snake the 6 pin receptacle end of
the cable out through the joystick port. For Best results, the right side
top or bottom half of the STFM / STE / Falcon case should be notched for
the 6 pin connector housing for best strain relief! Now you will have an
Atari lap keyboard with full Keyboard / Mouse / Joystick functions!
CB101909 $15.95

and this is their e-mail:

bestelec@concentric.net

Hi Sam =)
I got  one on Ebay a few months back when he had some up..(think he
owned Toad computers at one time) I will get his e-mail and send to
you if you like (look it up in my history file) He may still have a
few left

Thomas
